Department of Information Systems and Technologies

CTIS 365: Applied Data Analysis

Semester: SPRING 2025-2026

Lab Guide #6

OBJECTIVES: ggplot2
Instructor: Seyid AMJAD ALI **Assistant:** Efe Mert ŞAHİNKOÇ

Q1. Read dataset (sales_data.csv) that includes product categories and their total sales.

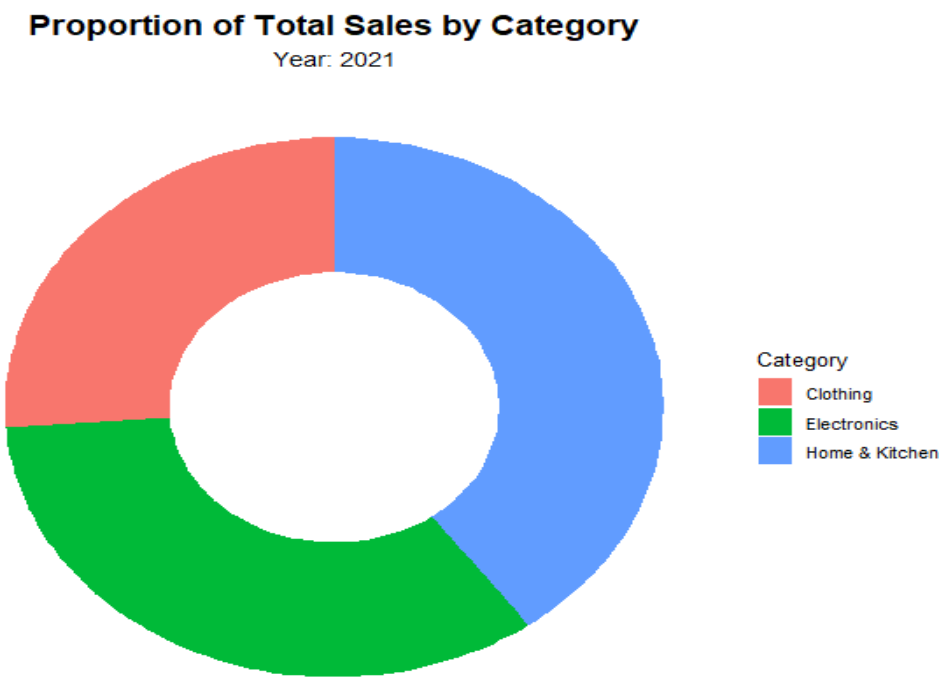
Use the data:

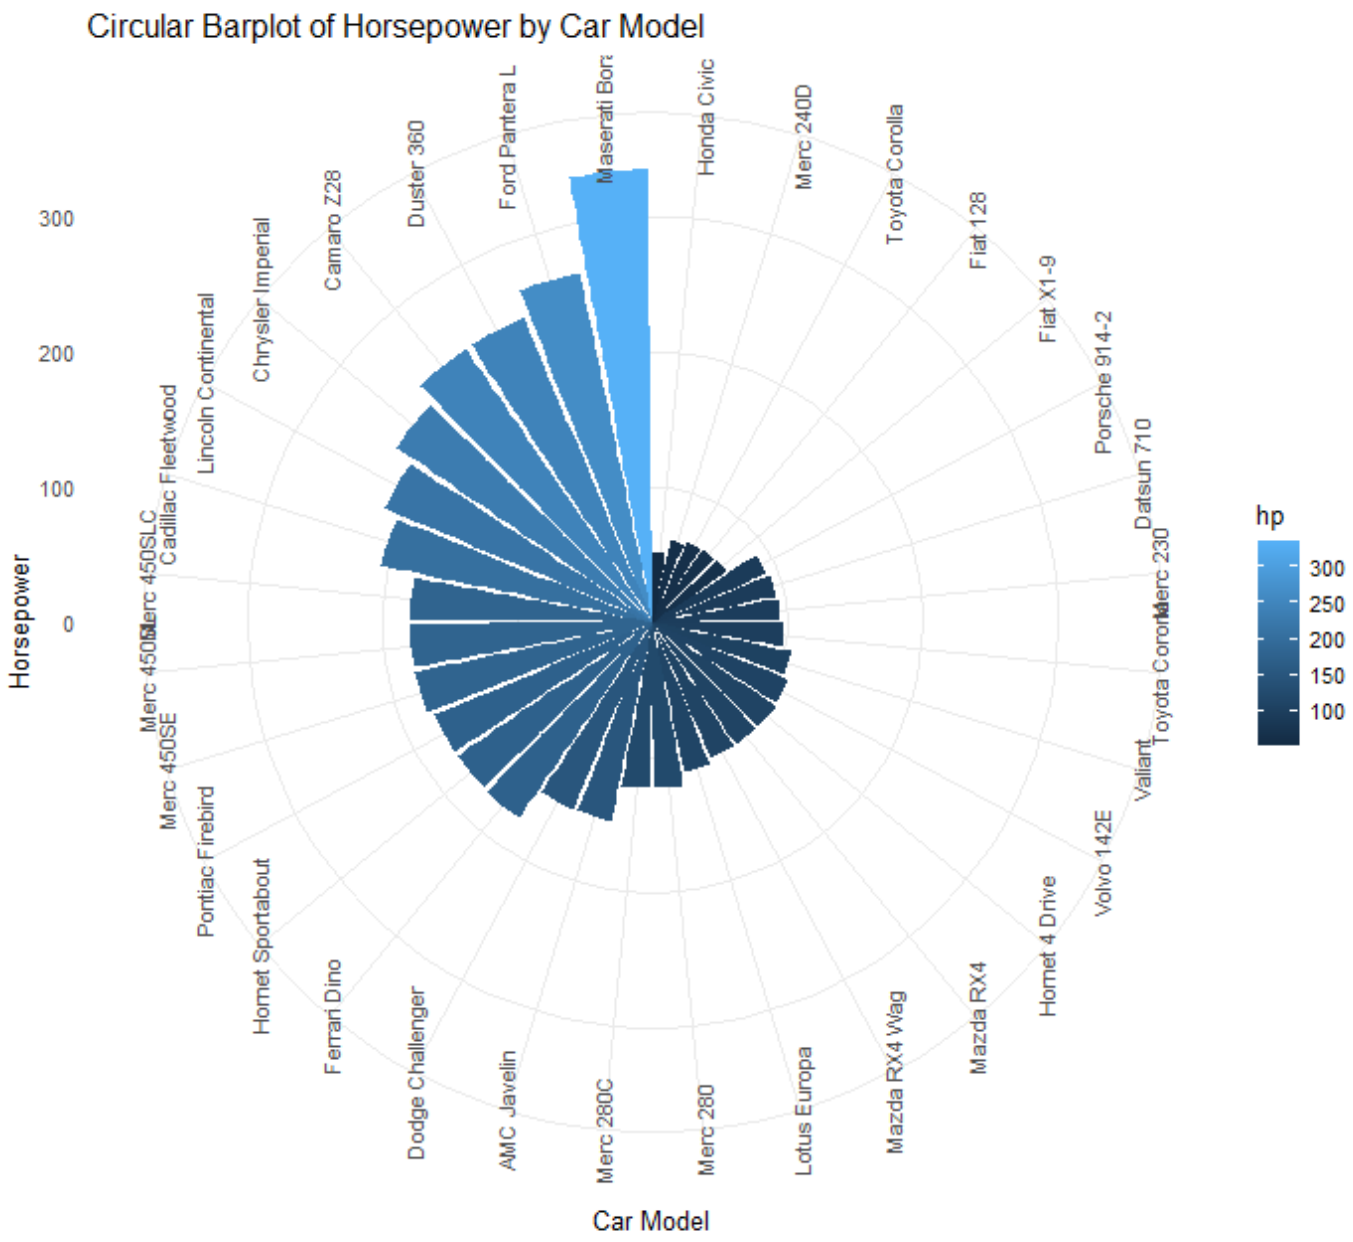
- Categories: 'Electronics','Clothing','Home & Kitchen'
- Year: 2021
- Only include products with total sales over $10,000

Create a donut chart that shows the proportion of total sales for each category.

Use ggplot2 or base R to build the chart.

Highlight and label chart to showcase each category's contribution.





Q2. Read and load the dataset provided (mtcars), ensure the car model names are part of the data. Create a circular barplot that effectively displays the hp for each car model. Ensure the barplot uses a polar coordinate system (coord_polar()) to represent the cyclical nature of the data. Choose appropriate color scales to differentiate between bars and make the visualization clear. Properly label each car model around the circle to make the comparison easy and intuitive.
